## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claim 21 is rejected under 35 U.S.C. 102(b) as being anticipated by Gabor.

Gabor discloses an electronic circuit comprising: a first electrode (column 2, lines 58-60) for electrical connection to an ionization detector system (column 2, lines 58-66); a second electrode (column 2, lines 58-60) for electrical connection to the ionization system; a transformer (fig. 1 (2)) electrically connected to the first electrode and to the second electrode for creating a spark between the first electrode and the second electrode; a DC voltage source (column 2, lines 29-31) electrically connected to a primary portion (fig. 1 (1)) of the transformer; and a current monitor (fig. 1 (9)) electrically connected to a primary portion of the transformer.

### *Claim Rejections - 35 USC § 103*

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claim 22 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gabor in view of Wolf.

Gabor discloses a method of generating an electrical discharge for an ionization detector system comprising: providing a first electrode and a second electrode (column 2, lines 58-60), each electrically connected to the ionization system (column 2, lines 58-66); providing a transformer (fig. 1 (2)) electrically that is connected to the first electrode and the second electrode; inputting a DC voltage into the primary portion of the transformer (column 2, lines 29-33); generating a discharge current between the first electrode and the second electrode (column 2, lines 45-60); and monitoring a current input (column 2, lines 38-40).

Gabor does not disclose including a first resistor and a second resistor in a secondary portion of the transformer.

Wolf discloses including a first resistor (17) and a second resistor (16) in a secondary portion of the transformer.

Therefore, it would have been obvious to one skilled in the art at the time of the invention to incorporate the resistors of Wolf into the method of Gabor for the purpose of controlling the voltages on the secondary side of the transformer.

***Allowable Subject Matter***

5. Claims 1-5, 7-18 and 20 are allowed.
6. The following is a statement of reasons for the indication of allowable subject matter:  
The claims are considered patentable because of the inclusion of the claim limitations: in claim

1, a conjugated clock input electrically connected to the transformer. In claim 11, generating a discharge current having at least a first steady-state current plateau and a second steady-state current plateau between the first electrode and the second electrode. These limitations are not taught or suggested by the prior art or record. Claims 1-5 and 7-10 are allowable since they depend on allowable independent claim 1. Claims 12-18 and 20 are allowable since they depend on allowable independent claim 11.
